## Ios 13 for iphone 6

Some pre-reviewers slammed the latest iPhones as quite obsolete when it comes to hardware. However, iOS 7 includes a number of major changes for Apple fans to process. First of all, the overall visual interface is quite different from older versions of iOS. It is considered the biggest overhaul for the operating system since 2007. In iOS 7, gone are frilly graphic flourishes, such as faux skins for the calendar app and three for the Newsstand app, replaced by a simpler, stripped-down look. There are new icons and fonts, transparency effects, and advanced graphics physics designed to make your screen look more three-dimensional. The so-called live wallpapers are on prominent screen in this iOS. Depending on your phone's direction, these wallpapers have bubbles on the screen floating around in different directions. Beyond the eye candy, there are many changes in the way iOS actually works as well. One of the most notable updates is Control Center access. Just swipe up anywhere and you'll have instant access to wireless options, screen light, flashlight, airplane mode and music controls. The burgeoning App Store, which is around 900,000 apps and counting, has improved search capabilities in iOS 7. There is also the long-standing opportunity to build Pandora-like radio stations around specific artists and songs. Apple's web browser, Safari, now has a combined URL and search text box. It simply means that you can either enter the website you want to access, or instead start an Internet search. Phones from other companies have been doing this for a while, but this is a first for iOS. Siri also now allows you to now open about as many tabs as you want, and then swipe them away when you're done with those pages. Voice command app Siri also has some new tricks. Just say increase the brightness of the screen or turn on WiFi, and Siri does it instantly. You can also choose new voices and languages for Siri. The version of iOS is also planned for all sorts of in-vehicle integration. In 2014, about a dozen automakers will offer screens that communicate directly with the iPhone. Just say a command and the car will read back messages to you (and let you talk answers), let you control the music system, and of course, control your mapping abilities. AirDrop is now integrated into the operating system. With AirDrop, you can use your iPhone to share files with other Apple products via a WiFi signal. The Camera app allows previews of various creative filters. You can also swipe through different frame shapes (for panoramic panoramic square). There are dozens of other smaller tweaks to iOS, all designed to make a complicated device easy to use. Later, you'll see how Apple's latest iPhone stacks up against its competitors. Apple officially launches iOS 13 in just over an hour, and a host of new iPhone features come with it, including a system-wide Dark Mode, a Find My App, a revamped Photos app, updated privacy features and street-level maps, not to mention hundreds of minor new changes and tweaks. This article covers some of the things you can do to prepare your iPhone for Apple's latest mobile operating system, including storage maintenance tips, backup advice, and some other useful things to consider before upgrading. First, make sure your iPhone is compatible with iOS 13. iOS 13 Compatibility Checker If you own an iPhone 6s or later, the device runs the latest operating system. Still unsure? Here's Apple's official compatibility list for iOS 13. iPhone 8 Plus iPhone 7 iPhone 7 Plus iPhone 6s iPhone SE iPhone SE iPod touch (7th generation) With the release of iOS 13, Apple improves the way apps in the App Store are packaged together, and it says users can expect app downloads that are up to 50 percent smaller, resulting in less storage taken up by apps. However, before you can take advantage of it, first make sure that your device has sufficient space to download and install the new operating system. With that in mind, it's worth looking at what apps you've installed on your devices and whether you really need them. Swipe through the Start screen and check into your folders to root out any forgotten apps that take up valuable storage space. To delete apps, hold a finger on them and tap the X that appears in the corner of the icon. You can also go to Settings -> General -> iPhone Storage, tap any apps you don't use, and select Delete app. Be ruthless — you can always reinstall removed apps at a later date if you change your mind. Check the size of social media or messaging apps you've installed, such as Facebook and WhatsApp. These apps can often balloon in size after long periods of activity due to chat history, media caching, and the like, so you may want to delete and reinstall them to restart. Also be sure to make your personal recommendations on the iPhone Storage Screen, such as keeping high-resolution photos in iCloud and smaller versions on your device, or letting iOS automatically offload any apps you don't use frequently. Creating an archived iTunes Backup It is best practice to have an iTunes backup of your device stored on your computer in case something goes wrong, or the worst happens and installation of iOS 13 fails. If you need to downgrade shortly after installing a new iOS update, it is necessary to create an archived iTunes backup in advance. An archive saves the current state of your iOS device and prevents it from becoming overwritten by subsequent backups. Here's how to do it on a Mac. (Note that if you're a Windows user, the iTunes procedure varies slightly and you'll need to rename your iTunes backup folder or move it to another location to prevent it from being overwritten). Connect your iPhone to a Mac with the latest version of iTunes installed (click iTunes -> Get Update for iTunes from the menu bar to be sure) and click on the device's icon in the iTunes' interface. Select This computer under backups, select Encrypt iPhone backup, and then enter a password. An encrypted backup keeps all your account passwords as well as your Health and HomeKit data, while a non-encrypted backup doesn't. Click Back Up Now and wait for the backup process to finish. Depending on the amount of data stored on your device, it should take between 5 and 25 minutes to complete. Save the backup To save the backup, select Settings from the iTunes menu and click the Devices tab. Right-click the new backup and select the Archive option. When the archiving process is complete, a backup is marked with the date and time it was archived. Archived backups can be viewed at any time in the iTunes Preferences section. You can also delete an archived backup from here – just select the appropriate backup and click the Delete Backup button. Install iOS 13 When iOS 13 becomes available (probably around 10 AM PST/1 PM EST on the official release day, based on previous releases) it will be delivered to your device either via iTunes when you connect it to your computer, or as an over-the-air update. Make sure your device is fully charged before you start the process via WiFi, as it may take some time to complete. Apple officially launches iOS 13 on Tuesday, September 19, and a host of new iPhone and iPad features come with it, such as a revamped control center, a new Files app, Drag and Drop gestures and several other updated design elements. This article covers some of the things you can do to prepare your devices for Apple's latest mobile operating system, including storage maintenance tips, backup advice, and some other useful things to consider before upgrading. First, however, it's worth finding out if your mobile devices are compatible with iOS 13. iOS 13 Compatibility Checker If you own an iPhone 6s or later, or an iPad Air or later, your device is running the latest operating system. Still unsure? Here's Apple's official compatibility list for iOS 11. iPhone: iPhone X, iPhone 8, iPhone 8 Plus, iPhone 7, iPhone 7 Plus, iPhone 6, iPhone 6 Plus, iPhone 6s, iPhone 6s Plus, iPhone SE, iPhone SE. iPads: 12.9-inch iPad Pro (1st and 2nd generation), 10.5-inch iPad Pro, 9.7-inch iPad Pro, iPad Air 2, iPad Air 1, iPad 5th Generation (2017 model), iPad mini 4, iPad mini 3 and iPad mini 2. iPods: generation iPod touch. Reclaim Device Storage Space iOS 11 includes new features to help you free up space on your iOS device, such as personalized recommendations for actions you can take to increase available storage. However, before you can take advantage of these, you should make sure your device has sufficient space to download and install the new operating system. With that in mind, it's worth reconsidering which apps you've installed on your devices and whether you really need them. Swipe through the Start screen and check your folders to root out any forgotten apps (including older 32-bit apps that don't work on iOS 11) that take up valuable storage space. To delete apps, hold a finger on them and tap the X that appears in the corner of the icon. Alternatively, go to Settings -> General -> Storage & iCloud usage -> Manage storage, tap on any apps you don't use, and select Delete app. Be ruthless — you can always reinstall removed apps at a later date if you change your mind. Check the size of all social media apps you've installed, such as Facebook and Snapchat. These apps can often increase in size after long periods of activity due to media caching and the like, so you may want to delete and then reinstall them to restart. If you're a WhatsApp user, open the app, go to Settings -> Data & Storage Usage, take a look at how many megabytes your chat history uses, and take an appropriate action to reduce storage. You can do this by the savings or simple step of deleting. If you are using Cloud Photo Library, you also worth checking that is configured correctly as well as local storage on your device as possible. Press through to Settings -> Privacy & Security > Camera, and then the Optimize iPhone Storage across devices. Open the iPhone Storage app and install any updates available to ensure maximum compatibility with iOS 13. An archived iTunes backup is just perfect to have on hand in case something goes wrong in the future, however, and installation of iOS 13 fails. If you need to downgrade shortly after installing a new iOS update, it is necessary to create a new archive. iTunes Backup in advance. Connect your iPhone to a Mac with the latest version of iTunes installed (click iTunes -> Get Update for iTunes from the menu bar to be sure) and click on the device's icon in the iTunes' interface. Under Backups, select This computer, select Encrypt iPhone backup, and then select password. An encrypted backup keeps all your account passwords as well as your Health and HomeKit data, while a non-encrypted backup doesn't. Click Back Up Now and wait for the backup process to finish. It should take between 5 and 15 minutes depending on the amount of data stored on the device. Save the backup To save the backup, select Settings from the iTunes menu and click the Devices tab. Right-click the new backup and select the Save option. When the archiving process is complete, a backup is marked with the date and time it was archived. Archived backups can be viewed at any time in the iTunes Preferences section. You can also delete an archived backup from here – just select the appropriate backup and click the Delete Backup button. Install iOS 13 When iOS 13 becomes available (probably around 10 AM PST/1 PM EST on Tuesday, goes on previous releases) it will be delivered to the device either via iTunes when you connect it to your computer, or as an over-the-air update. Make sure your device is fully charged before you start the process via WiFi, as it may take some time to complete. Complete.
